DRAFT

The project must be implemented in Php + Mysql, inserted into a website with password-controlled access and control code.
Realize a database that manages organized crime:
- Criminals are organized in bands; of each of them, identified by a code, are concerned with the master data, the band to which it is affiliated, any crimes that are charged with the year in which the investigators have formulated the indictment.
- Of each band, identified by the name, interests the leader and other affiliates, the other bands with whom he eventually collaborates. A band is made up of at least three affiliates, including the boss.
- Of any crime, identified by a code, affects the place and date, the affected people, any responsible.

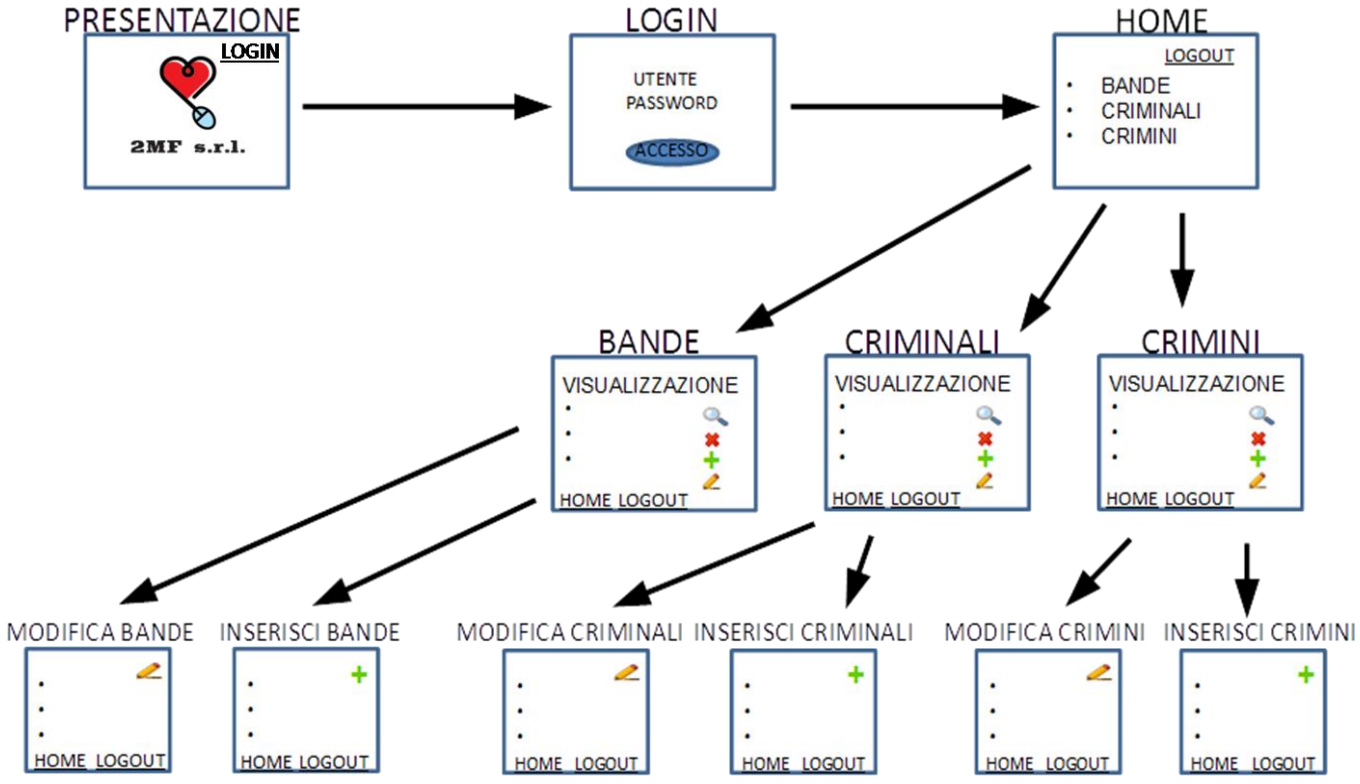
For each table, the information system must be able to ensure the insertion, modification, search, deletion and video printing.

In what environment will the software be used?

This database allows agents, through authorized access to an on-line management, to record, search, modify, delete and view tables that allow the user to monitor transactions involving anthymics and counterterrorism in Italy.

How is the site structured and how does it appear on the Web?

The site is structured on twelve pages:
- HOME explains the operation and content of online management;
- LOGIN allows authorized users access to sensitive data;
- The MAIN PAGE allows you to choose between the bands, criminals and the tables crimes;
- BANDA, CRIMINALI and CRIMINI pages allow initially to display the entered data and then choose between creating a new data, editing or deleting it. The edit and insertion options are managed through new specific pages.



What is our engaging message?

Our projects are carried out by a qualified and qualified team who will be able to meet the required demands.

How do you use the management?

To populate the database, you must enter the data according to a specific order:

1. BANDE, as it does not require the insertion of existing data into other tables;
2. CRIMINALI requiring the insertion of the_band code referring to the previous table;
3. CRIMINI in which only the code and the related crime are to be inserted which is independent of the insertion of the data in the other tables;
4. COMPUTER must be populated last since it is a table formed by the connection of the other two, it must contain previously entered data in the CRIMINAL and CRIMINI tables.

How are the tables structured?

The project envisages the creation of a database that manages organized crime in:

- CRIMINALI: each criminal is identified by a unique code that automatically increments itself (AUTOINCREMENT code).
  After that you enter the master data relating to the subject (name, surname, date_nascita); in addition to the code of the band to which it belongs (code_band) and its role (role) in it. It is possible to insert, using three optional attributes, any bands with which they collaborated (collab1, collab2, collab3)

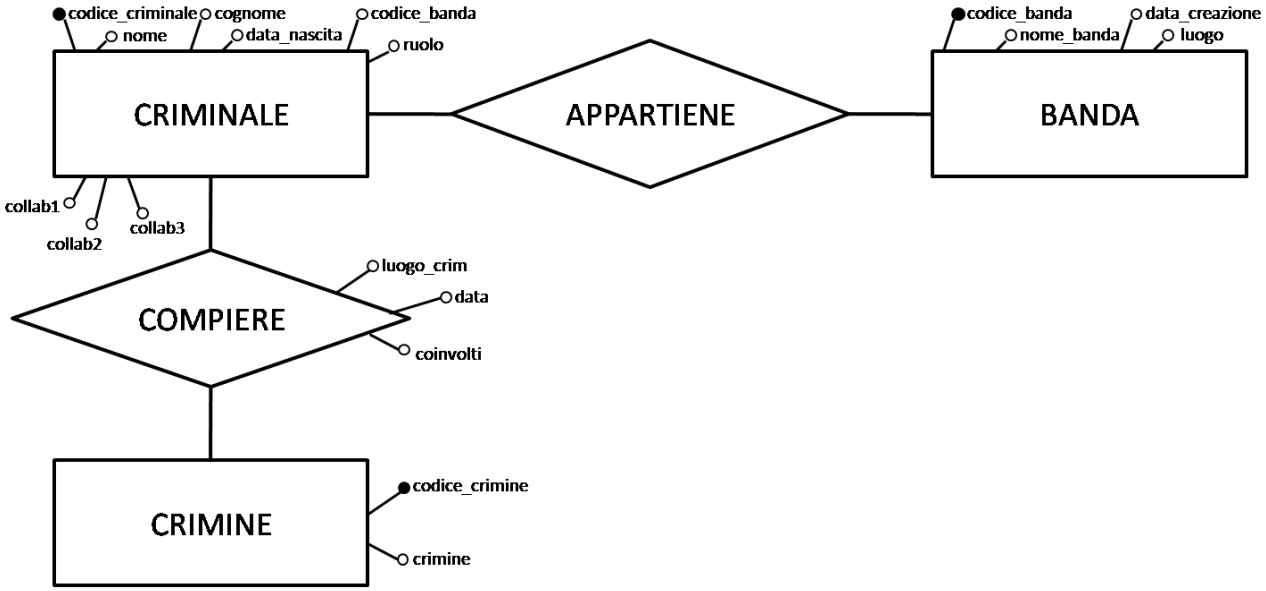
- CRIMINALI: each criminal is identified by a unique code that automatically increments itself (AUTOINCREMENT code)After that you enter the master data relating to the subject (name, surname, date_nascita); in addition to the code of the band to which it belongs (code_band) and its role (role) in it. It is possible to insert, using three optional attributes, any bands with which they collaborated (collab1, collab2, collab3).

- BANDE: Each band is identified by a unique code that increases as the number of criminal groups increases (AUTOINCREMENT_BAND_BAND); In addition, the identification data (name_band, place, date_creation) is entered.

- CRIMINI: Every crime is identified by a unique code that automatically increments itself (AUTOINCREMENT CRIME code) to which the type of crime (crime) is associated.
- TAKE: It is a table created for connecting many to many of the CRIMINAL and CRIME Tables; in this table there are two primary keys (Criminal Code, Criminal Code) and the crime is described (place_crim, date, involved).

The system allows for each table:

- Insertion
- Edit
- Search
- Cancellation
- Printing (on video)



BANDE (codice_banda, nome_banda, luogo, data_creazione)

CRIMINALI (codice_criminale, nome, cognome, data_nascita, codice_banda,
collab1, collab2, collab3, ruolo)

COMPIERE (codice_criminale, codice_crimine, luogo_crim, data, coinvolti)

CRIMINI (codice_crimine, crimine)
